

A Guide on Growing a Type 40 Time and Relative Dimension in Space (TARDIS) Capsule

So, you're in a pinch and a fellow Time Lord has broken off a piece of their Type 40 TARDIS capsule so you can keep going through your travels through the Time Vortex. But they dematerialised without giving you instructions.

You've come to the right place.

MATERIALS NEEDED

- A piece of a Type 40 TARDIS capsule
- Sonic Device
- Shatterfry-Capable Device (**SCD**)
- Regenerative Energy (**OPTIONAL**)
- This Instruction Sheet

INSTRUCTIONS

1. Gather all materials.
2. Bury the piece of capsule at least 1.82m (6ft) underground in fertile soil.
NOTE: Prepare the soil as you would the local flora and fauna. Type 40 TARDIS capsules are designed to be adaptable to any fertile soil.
3. Care for the capsule seed as you would for the local plant life for two local growth cycles or until the plasmic shell is visible and covers the capsule part. (Congratulations! You now have a TARDIS seed.)
4. Use your SCD to shatterfry the plasmic shell for exactly 61 attoseconds.
NOTE: Anything more or less would run the risk of the plasmic shell cracking and shattering when the dematerialisation process begins. If this happens, you and your passengers will become exposed to the Time Vortex itself. There is no evidence a Time Lord can survive long enough to trigger the regeneration process.
5. Using your Sonic device, locate the dimensional stabilisers and modify its settings to create a foldback harmonic of 36.3. This can accelerate the growth power by 59.
6. Repeat steps 2-3, this time for at least 16 growth cycles.
7. **OPTIONAL:** If you wish or need to shorten the growth period, focus your own regenerative energy into the TARDIS seed. This will make the seed grow faster due to the Rassilon Imprimatur being formed during the formative phase instead of it developing much later. However, this will syphon a lot of regenerative energy from you. It is possible this can take away one or more regenerations from your regeneration cycle. We can only recommend this in an extreme case of emergency and with at least three regenerations still left. Releasing regenerative energy may cause complications in any future regenerations.
8. Once the TARDIS seed has grown enough, the Rassilon Imprimatur will grant you telepathic access to the TARDIS itself. If you are in a pinch, from here you can use the

dematerialisation process to escape. However, this will burn out several components that have not fully matured. Most notably are the dimensional dams. If you want a fully formed and functional timeship, we recommend letting the seed grow until the chameleon circuit is functional.

9. Enjoy your travels!
